In liquids it usually decreases with increasing temperature, whereas, in most gases, viscosity increases with increasing temperature. This article discusses several models of this dependence, ranging from rigorous first-principles calculations for monatomic gases, to empirical correlations for liquids.

Temperature dependence of viscosity - Wikipedia  
The temperature dependence of solution viscosity was analyzed using the Andrade-Eyring equation to determine the effective activation energy of viscous flow (Ea,?). While Ea,? values were different for each protein, they were independent of formulation conditions for a given protein.

Temperature Dependence of Protein Solution Viscosity and ...  
A correction to the simple exponential temperature dependence of viscosity arises because of a difference between the real and ideal conditions for a viscous fluid flow. This correction is similar to those to pressure and volume in the real gas law. As a result, the expression for viscosity takes the form.  $\eta = \eta_0 \exp \left( \frac{E}{k(T + T_0)} \right)$ .

Temperature dependence of viscosity | SpringerLink  
The effect of temperature on the kinematic viscosity of liquid is described by means of the Arrhenius equation as,  $\nu = A \exp \frac{E}{RT}$  ? being the kinematic viscosity, E a the activation energy for flow, R the universal gas constant and T the absolute temperature.

The Temperature Dependence of the Viscosity of Liquids. Gutmann, F. ; Simmons, L. M. Abstract. The equation  $\log \nu = A + B / (T + C)$  is obtained as a simple modification of Andrade's viscosity equation by treating the activation energy as a function of temperature, A, B, and C being free parameters. This is shown statistically to express adequately the temperature dependence of viscosity over substantial ranges of temperature for all the liquids examined, viz., n-heptane; n-nonane; n-undecane;

ties the viscosity to change with the Rayleigh number. Dependence on Eq. (5) reduces to that of constant viscosity if  $\beta = 0$ , while for temperature-dependent viscosity we consider  $\beta = 0.0862$ : The viscosity contrast in equation (5) for Rayleigh numbers up to  $R = 120$  (as employed in this article) is 3:1 104.

Concentration and Temperature Dependence of Viscosity in ...  
Because viscosity is exponentially dependent on protein concentration, it can vary considerably from lot to lot in this concentration specification range. Viscosity increases exponentially with decreasing temperature, so a significant range of viscosity values may be encountered for high? concentration MAB drug products when they are stored at 2-8 ?C and at ambient temperature of ?25 ?C.

Temperature, Viscosity, and Concentration in Parenteral ...  
The temperature dependence of liquid viscosity is the phenomenon by which liquid viscosity tends to fall (or, alternatively, its fluidity tends to increase) as its temperature increases. This can be observed, for example, by watching how cooking oil appears to move more fluidly upon a frying pan after being heated by a stove.

Temperature dependence of liquid viscosity  
The viscosity is generally pressure and above all temperature dependent. With liquids, viscosity decreases with increasing temperature. This behavior is very clearly shown with honey or butter, for example. If these substances are heated, they become more flowable, almost like "real" liquids, i.e. the viscosity decreases. But also water shows a pronounced temperature dependence.

Viscosity of liquids and gases - tec-science  
In order to formulate the dependence of hydrocarbon liquid viscosity on temperature, a number of relations were proposed. The logarithmic values of dynamic or kinematic viscosity that constitute the temperature exponential function are used most frequently:  $\log(\nu) = a + c/T$  or  $\log(\nu) = a + b/T^2$  Where

Temperature dependence of viscosity - NASA/ADS. Two approximate formulas describing the temperature dependence of the coefficient of viscosity of rarefied gases are presented. Both formulas are obtained by approximating the collision integral for interaction potential. The first formula describes the behavior of the viscosity coefficient at moderate and high temperatures and can be illustrated by experimental data on neon, krypton, nitrogen, and air at temperatures up to 2100 K.

Temperature dependence of viscosity - NASA/ADS  
An exponential model for the temperature-dependence of shear viscosity ( $\eta$ ) was first proposed by Reynolds in 1886.  $\eta(T) = \eta_0 \exp(-b/T)$  where T is temperature and  $\eta_0$  and

Temperature dependence of liquid viscosity ...  
In many cases, the temperature dependence of the kinematic viscosity of liquid metals and melts can be approximated by the two-parameter Arrhenius type formula (e.g., see [85,86])  $\nu = \nu_0 \exp(-E_a/RT)$  ;  $\delta P \dots$
